Sierra Systems
an NTT DATA Company

Move Data Nearly Anywhere with *Sierra Connect*

Imagine the business value of synchronizing every workflow in your enterprise with shared data

Sierra Connect allows users to create workflows that collaborate on data between applications. Moving source data through a secure cloud via the Azure framework, Sierra Connect makes your data available for other systems to utilize seamlessly.

Sierra Connect is easy-to-launch, and application-agnostic. Sierra Systems, an NTT DATA Company, can train your IT team to use the Microsoft Azure platform to synchronize source data from any application of their choosing to any connected application.

Sierra Connect

Sierra Connect sits outside your applications and does not touch any source code. By only targeting data points, Sierra Connect insulates your workflows from application updates or modifications.

Case Study: Connect Microsoft Dynamics AX and CRM

Two of the most powerful tools in the Microsoft cloud can now be integrated to allow end-to-end commerce. Sierra Connect's "light touch" interface collects and shares data sources between AX and CRM systems.

New on-premise Microsoft Dynamics workflows connect AX and CRM customer information with sale data to create an automated prospect-to-sale-to-shipping workflow, layering cloud technology with on-premise security.

As powerful as AX-CRM integration is, Sierra Connect's strength is its ability to replicate enterprise data through into additional applications via new workflows.

Design & Build the Most Efficient Workflow You Can

Initially designed to integrate Microsoft Dynamics AX & CRM, Sierra Connect is an Azure-based framework lets you move source data between platforms, using minimal coding to share it with any other online or hybrid-connected system.

Sierra Connect allows your team to design workflows by moving data between connected applications.

Design Enterprise Workflows with Sierra Connect

Sierra Connect creates a pool of enterprise data, for a do-it-yourself data source-to-data source solution that can be configured to synchronize the applications your teams need to create their workflows.

The data is moved using Microsoft's Azure standards for security and pretested integrations. Sierra Connect uses these standards to let your team pick from many connection data points, and feed it into almost all standard Microsoft applications, often with bi-directional workflow capability.

Connect To Any Data Source

Oracle to Microsoft SQL
- Drastically cut integration time on migration projects with standard baseline data

Inventory to Warehouse
- Popular and custom applications can be integrated for automated notifications

Oracle | Cognos | Active D. | Axios | Google | Magento | Amazon | Salesforce

Azure | Power BI | SharePt. | Flow | DropBox | Workday | Infor | Adobe

AX | CRM | SQL | Excel | Teams | Tickers | JIRA | Mailchimp

Dynamics | F & O | Sales | Proj. Auto. | Cust. Ser. | Field Serv | Marketing | Office

Wordpress | Gmail | Twitter | Epic | Facebook | SAP | OneDrive | 1,000s more

Social Media to Microsoft Dynamics
- Reviews and reactions can feed sales reports and matched to client profiles

Payroll to DropBox
- Updates become available to your team, clients or suppliers

Project Management to ERP to Finance to Project Management
- Modify budgets and update expectations based on the exact tracking of project tasks to burn-down schedules

Modify How Everyone Does Business

At the heart of Sierra Systems' services is our optimization of business workflows that work hand-in-hand with new technologies, helping clients adopt the new workflows into their enterprise. We can help you design and implement the business value your organization has been waiting for.

The Power of Sierra Connect

- **Unified**: Centralize integrations into one platform.
- **Simple**: Make the source and target systems agnostic to the data being integrated. No custom code needed!
- **Expandable**: Use the ever growing out-of-the-box platform and integration connections provided by Microsoft
- **Secure**: Track delivery of data packages with full error recovery and retry
